# Selecting Appropriate Counter-Measures in an Intrusion Detection Framework

Frédéric CUPPENS, Sylvain GOMBAULT, Thierry SANS

[www.enst-bretagne.fr](http://www.enst-bretagne.fr)

## Outline

---

### ■ Cooperative intrusion detection

- Response and counter-measure
- Counter-measure taxonomy
- Modeling counter-measures
- Counter-measure selection
- Response mechanism
- Conclusion and future works

## ■ Cooperative intrusion detection

---

### ■ Several approaches to design IDS (Intrusion Detection System)

- Signature based (Misuse detection)
- Behavior based (Anomaly detection)
- Policy based

### ■ Several types of IDS

- Host based
- Network based

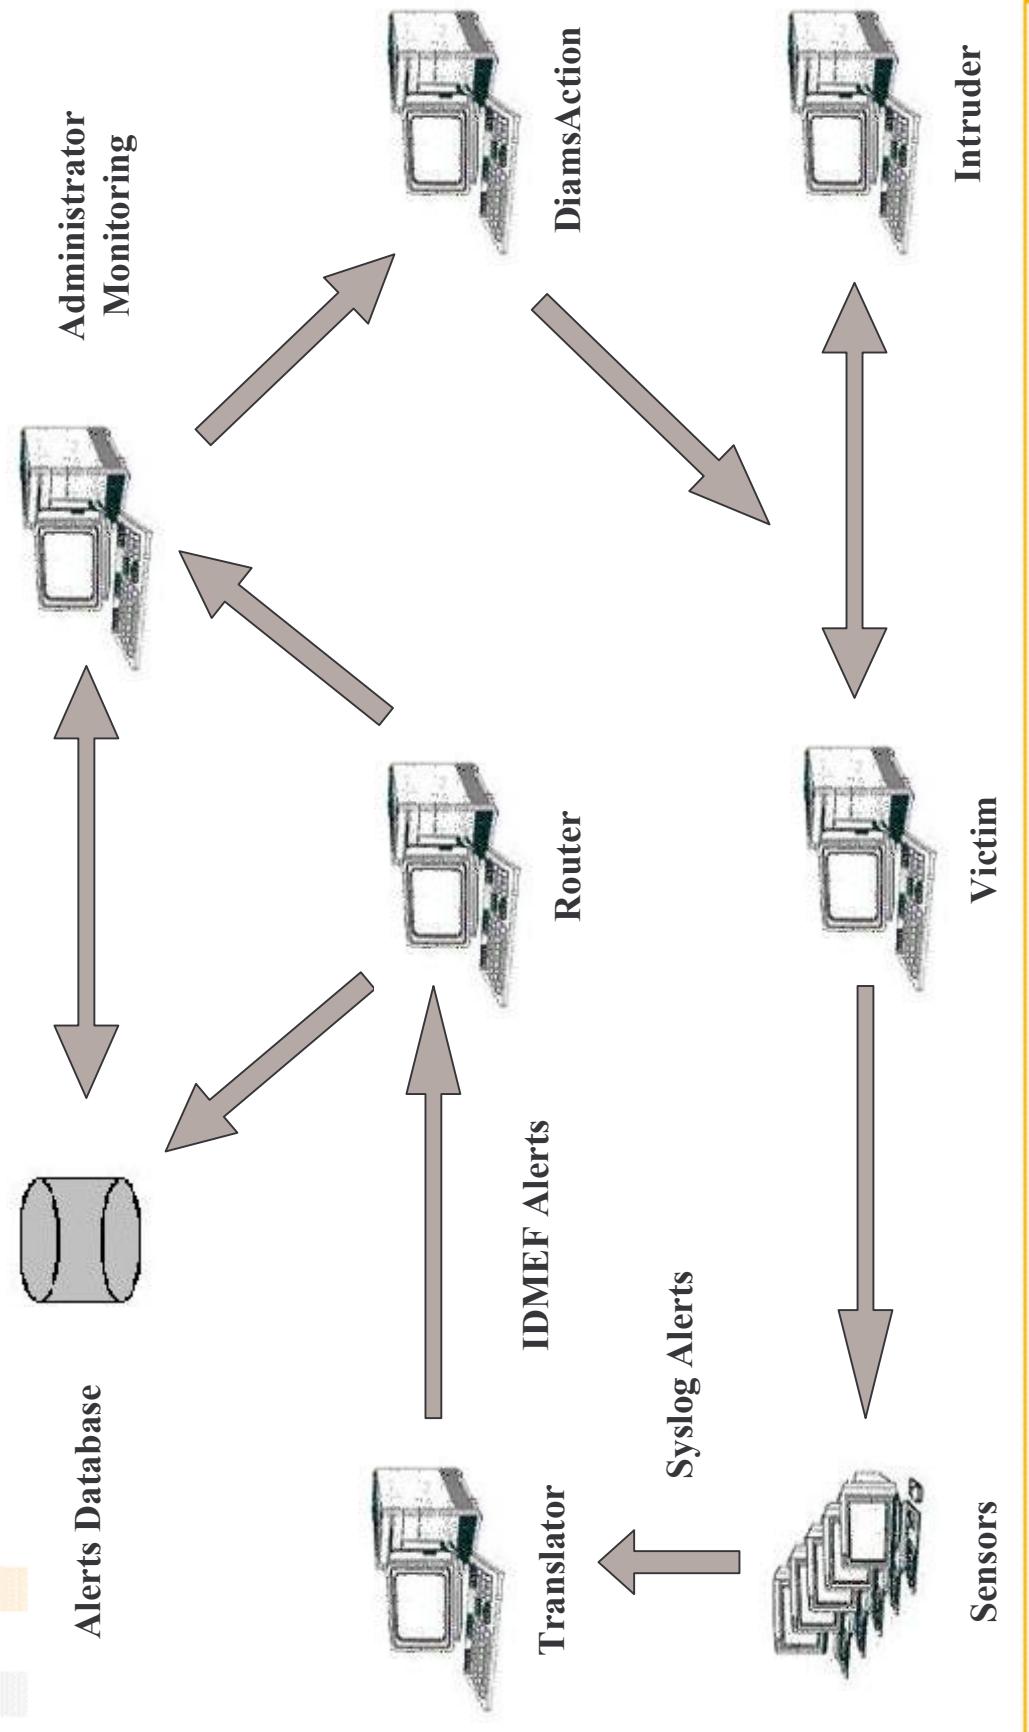

### ■ How to improve the global diagnosis ?

➤ Use several IDS in a cooperative framework.

## ■ Cooperative intrusion detection

# DIAMS : A cooperative intrusion detection framework

## ■ Cooperative intrusion detection

---

### ■ How to reduce the number of alerts ?

➤ Clustering and merging alerts

### ■ How to obtain a real diagnosis of the intrusion ?

➤ Correlation

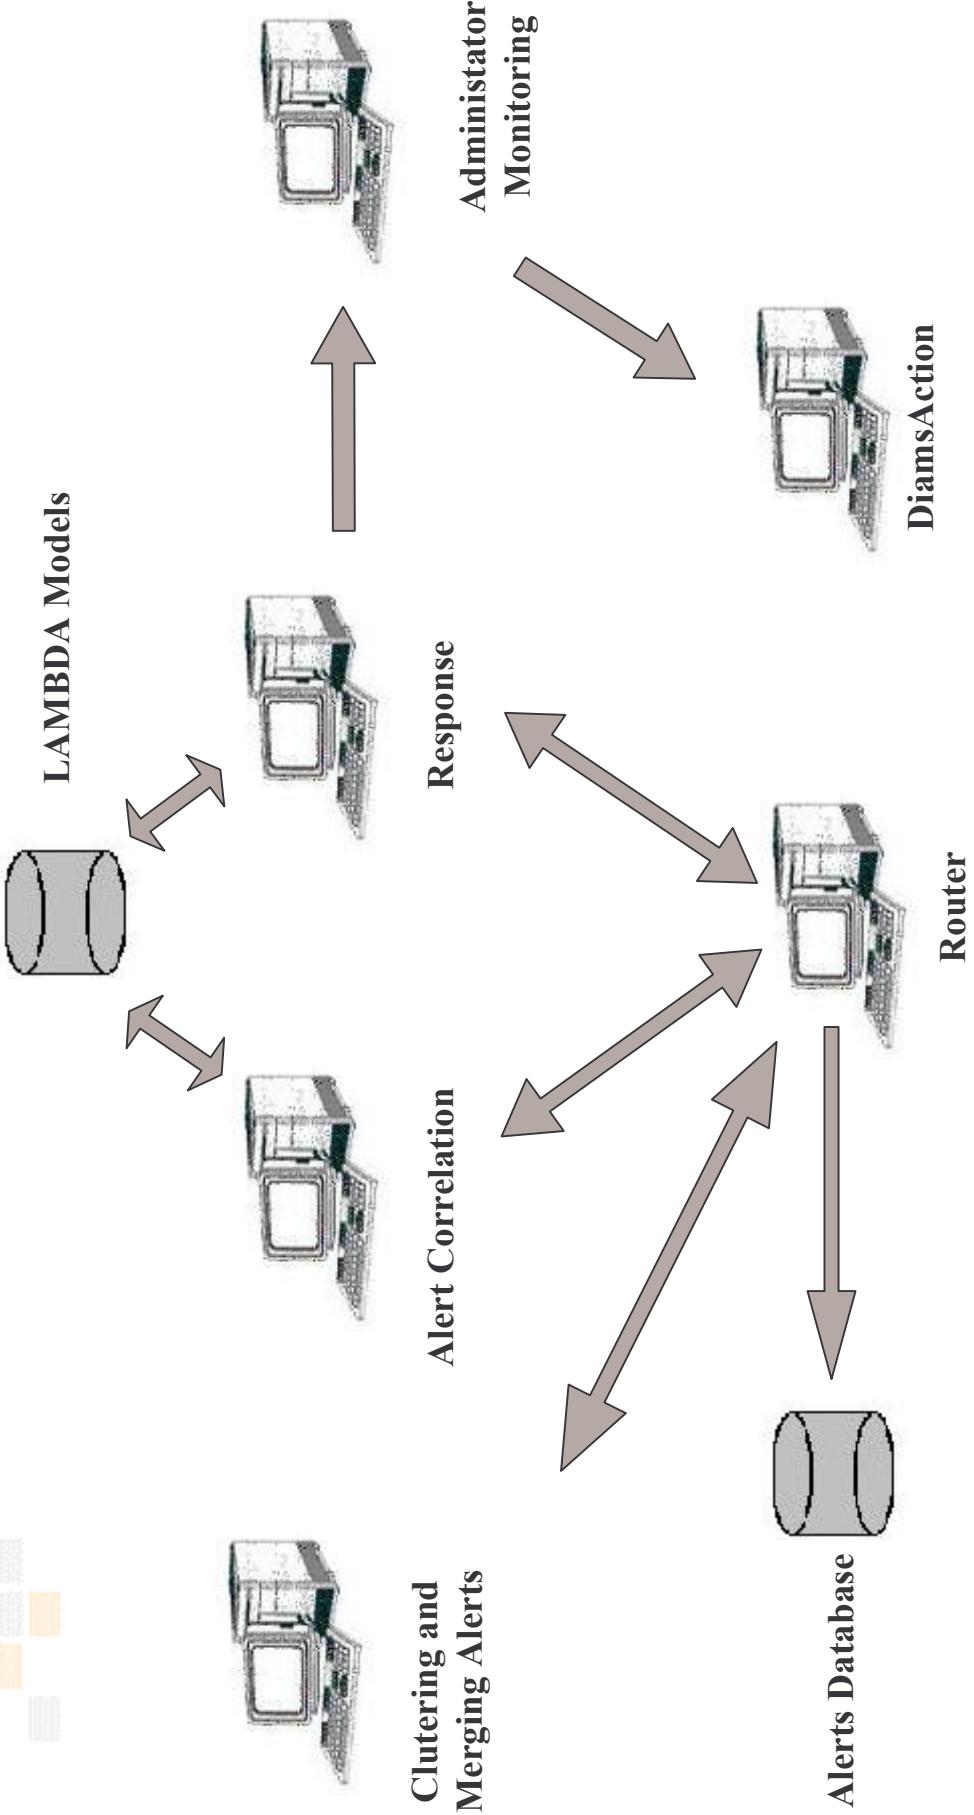

### ■ How to select the best counter-measure for a detected intrusion ?

➤ Response

## ■ Cooperative intrusion detection

## CRIM : Correlation and intention recognition module

- Response and counter-measure

---

■ **Counter-measure:** Action performed in order to prevent an intrusion.

➤ Design a library of counter-measures

- Response: Mechanism used to select the best counter-measures when an intrusion objective is identified by the correlation process.
  - The security administrator can decide to apply or not counter-measures.

## ■ Counter-measure taxonomy

---

### ■ Information

➤ Raise an alert to the security administrator

### ■ Deterrence

➤ Action performed against the intruder in order to stop his/her intrusion

### ■ Correction

➤ Action to modify system state to correct an identified vulnerability or misuse configuration

### ■ Compensation

➤ Action performed to block the attack but without correction

## ■ Modeling Counter-measures

In CRIM, LAMBDA (Language to Model a DataBase for Detection of Attacks) is used to model both attacks and intrusion objectives.

➤ Use LAMBDA to model counter-measures

## ■ LAMBDA specification of counter-measure

➤ Example : TCP-Reset

***counter-measure close-remote-access(Source,Target)***

*pre* : remote-access(Source,Target)  
*action* : TCP-Reset (Source, Target)  
*post* : not(remote-access(Source,Target))  
*verification* : not(TCP-connection(Source,Target))

## ■ Counter-measure selection

- Response mechanism is used to choose the best counter-measure in the counter-measure library to prevent the intrusion objective or future attacks.
  - Use anti-correlation to select counter-measures

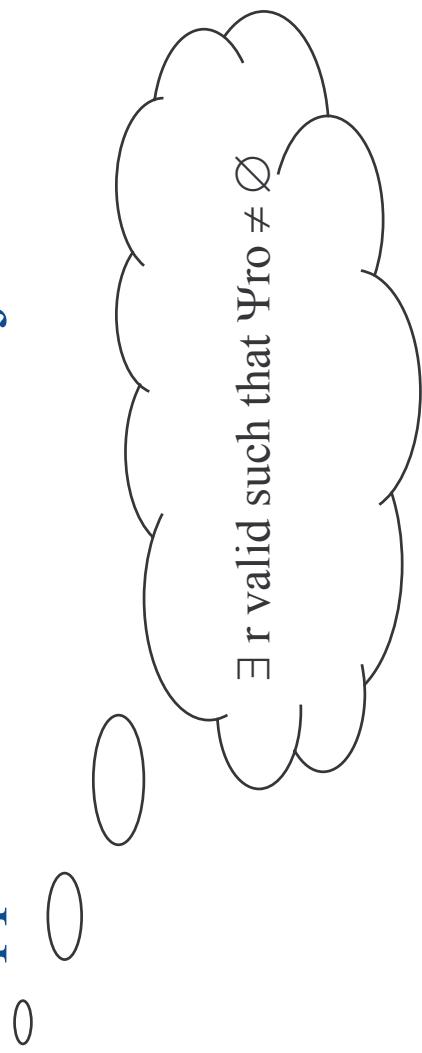

- Anti-correlation: Two actions are anti-correlated when post-condition of the first action disable the pre-condition of the second action

$\exists E_a$  and  $E_b$  such that:

$(E_a \in \text{post}_a \wedge \text{not}(E_b) \in \text{pre}_b)$  or  $(\text{not}(E_a) \in \text{post}_a \wedge E_b \in \text{pre}_b)$   
and  $E_a$  and  $E_b$  are unified through a most global unifier  $\Theta$ .  
 $\Psi_{ab}$  is the anti-correlation unifier: set of possible unifiers  $\Theta$  between  $\text{post}_a$  and  $\text{pre}_b$ .

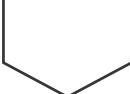

## ■ Response Mechanism

### Response mechanism applied to intrusion objective

Counter-measure  $r(Z_0)$

pre :  $\text{not}(r(Z_0))$

post :  $\text{r}(Z_0)$

$$\Psi_{\text{ro}} = \{\{Z_0 / Z'\}\}$$

attack  $c(Y, Z)$

pre :  $q(Y)$

post :  $\text{not}(r(Z))$

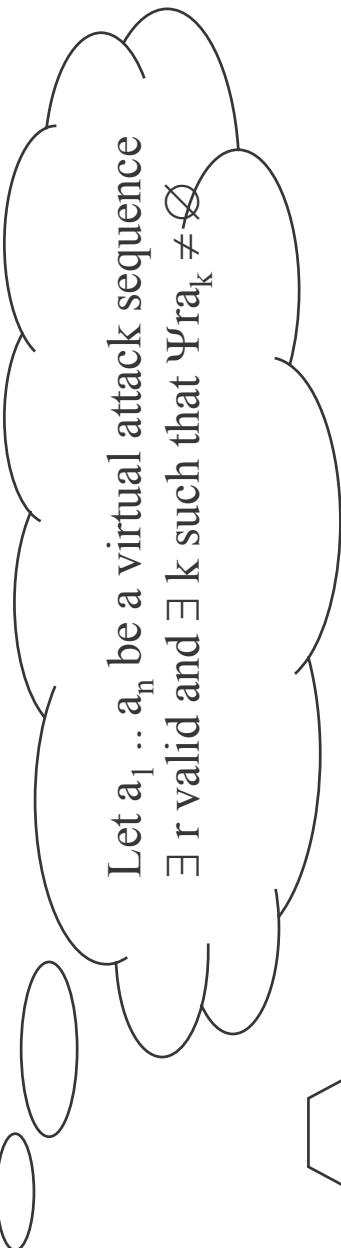

objective  $o(Z')$   
state : **not( $r(Z')$ )**

## ■ Response Mechanism

### Response Mechanism applied to a virtual attack

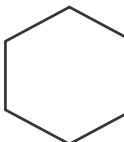

sequence

Counter-measure  $r(Y_0)$

$q(Y_0)$

$\text{not}(q(Y_0))$

pre :

post :

$$\Psi_{rc} = \{\{Y_0 / Y\}\}$$

attack  $b(X', Y')$

pre :  
 $p(X')$

post :  
 $q(Y')$

attack  $c(Y, Z)$

pre :  
 $q(Y)$

post :  
 $\text{not}(r(Z))$

## ■ Conclusion

---

■ Unique specification language, LAMBDA is used to model both:

- Attacks
- Objectives
- Counter-measures

- Logical model for:
  - Alert correlation
  - Selection of appropriate counter-measures (anti-correlation)

## ■ Future works

### Works in progress

- Improve clustering and merging alerts algorithm
- Improve correlation with weighted correlation
- Model complex scenarios
  - Mitnick attack, DDOS, ...
- Investigate firewall re-configuration as possible counter-measures

### ■ Future works

- Tests of performances
- Take care of availability requirements when selecting counter-measures
